

HOW TO MASTER CLAUDE IN ONE WEEKEND

9 STEPS • NON-TECHNICAL • NO CODING

What's Inside

SECTION	TOPIC
Introduction	Why AI changed trading forever
Part 1	The History: From algo trading to Claude Code
Part 2	What Claude Code actually is
Part 3	The 15 core concepts you need
Part 4	The claude-trading-skills toolkit overview
Part 5	Every skill, explained in detail
Part 6	Real workflows, step by step
Part 7	6 lessons from 900+ hours of research
Part 8	Complete API reference table (all 40+ skills)
Part 9	API setup and costs
Part 10	Meta tools and the self-improvement system
Part 11	Your week-by-week starting path
Part 12	Final word

INTRO

Why You're Reading This

Every major shift in trading starts with a tool that changes who can compete. The ticker tape. The Bloomberg terminal. Electronic order routing. Algorithmic trading platforms. AI agents are next.

-- SoulzBTC

You are reading this at an interesting moment in trading history. Not because AI is new. Not because chatbots exist. But because for the first time, AI tools have crossed a threshold where a single trader, sitting at a laptop, can build and run research workflows that used to require an entire quant team.

That shift happened fast. And most traders missed it because they got distracted by the hype and skipped the actual learning.

This guide is the learning. Everything you need to understand about Claude Code, how it works, what it can do for your trading, and exactly how to set it up so it actually works instead of wasting your time.

I am going to start at the beginning. The actual history. Because understanding where we came from makes it a lot clearer why Claude Code matters so much right now.

01

The History of AI in Trading

How we got from ticker tapes to Claude Code

To understand why Claude Code is a big deal, you need to understand the history of how technology has changed trading over the last 50 years. Every major leap gave an edge to whoever adopted it first. Every time, the majority of traders were late.

1970s

The First Quantitative Revolution

Fischer Black, Myron Scholes, and Robert Merton publish the Black-Scholes options pricing model in 1973. For the first time, complex derivatives can be valued systematically. Math replaces pure intuition for a specific class of trades. Wall Street hires its first quants.

1980s

Program Trading and the Rise of Algorithms

Electronic trading begins replacing phone-based order routing. Firms write simple rule-based programs to execute trades automatically. The 1987 Black Monday crash is partly attributed to portfolio insurance algorithms all selling simultaneously. The first lesson that automated systems have emergent, unexpected behaviors at scale.

1990s

The Bloomberg Terminal Era

The Bloomberg terminal becomes the standard for institutional traders. Real-time data, news, and analytics in one place. Cost: \$24,000 per year. The information edge is expensive and purely institutional. Retail traders are locked out.

1990 to
2018

Renaissance Technologies and the Quant Arms Race

Jim Simons' Medallion Fund averages 66% annually before fees using purely mathematical models. Renaissance proves that systematic, data-driven trading can consistently outperform human discretion. The quant arms race begins. The barriers: a PhD, a Bloomberg terminal, and a supercomputer.

2000s

High Frequency Trading

Firms build systems executing thousands of trades per second using co-location servers physically placed next to exchange matching engines. Speed becomes an edge measured in microseconds. Retail is locked out entirely at this layer.

2010s

APIs Open the Door for Retail

Interactive Brokers, Alpaca, and others release public APIs. Individual traders can now write code that connects to their brokerage and executes trades automatically. Python becomes the default language for retail quant trading. Zipline, Backtrader, and Quantopian give retail backtesting capabilities. The gap narrows, but you still need to code.

2016 to
2020

Machine Learning Enters the Chat

Hedge funds deploy ML models for prediction and portfolio optimization. Two Sigma and Citadel use deep learning for pattern recognition across massive datasets. NLP pulls signals from news and earnings calls. Again, the barrier is data, compute, and talent.

2022

ChatGPT Changes the Conversation

OpenAI releases ChatGPT. Millions interact with a large language model for the first time. Traders ask it trading questions. Most get generic answers. Useful for writing and explanation. Cannot touch data, cannot run code, cannot take actions.

2023

AI Coding Assistants Go Mainstream

GitHub Copilot, Claude, and GPT-4 become mainstream coding assistants. Traders who can code get faster. Non-coders are still locked out of building systematic workflows.

2024

Claude Code Changes the Category

Anthropic releases Claude Code: an AI agent running in your terminal, reading your files, executing code, connecting to live data sources, maintaining persistent memory. For the first time, a non-coder can describe a trading workflow in plain English and have it built and executed automatically.

2024 to
2025

The MCP Era

Model Context Protocol allows Claude Code to connect directly to external APIs, databases, and services. Exchange API, data provider, research database, portfolio tracker, all orchestrated by one agent from one conversation window.

Now

The Window Is Open

The tools are mature enough to be genuinely useful. The adoption curve is early enough that building systematic AI workflows now gives you a real process advantage. This guide is about how to be one of the early movers.

THE WINDOW

Every major technology shift in trading created a window of advantage for early adopters. Algorithmic trading. APIs. Machine learning. Each time, a small number of traders moved fast and built durable edges. Claude Code is one of those windows. It is open right now.

2018

Year quant strategies
peaked in AUM

\$24k/yr

Bloomberg terminal
annual cost (1990s)

66%

Renaissance Medallion
avg annual return

2024

Year Claude Code
broke the barrier for
retail

02

What Claude Code Actually Is

Not a chatbot. An agent.

Most people hear Claude Code and think it is a coding-focused version of the Claude chatbot. It is not. It is a completely different category of tool.

The Chatbot vs. The Agent

A chatbot is a question-and-answer interface. You provide input, it generates a response. It cannot touch your files. It cannot run code. It cannot make API calls. It just produces text.

An agent can take actions in the real world. It reads and writes files on your computer. It executes scripts. It installs software. It calls external APIs. It chains multiple tasks together to accomplish a larger goal. Claude Code is an agent.

CHATBOT	AGENT (CLAUDE CODE)
Generates text responses	Takes real actions on your computer
No file access	Reads and writes your files
No code execution	Runs Python, bash, any script
No API connections	Connects to live data via MCP
Session memory only	Persistent memory via CLAUDE.md
You do the work after	It does the work for you
Context resets every chat	Context builds across sessions

The Three Built-In Tools

Claude Code has three tools it uses automatically depending on your goal. You never specify which one:

- Read: reads files and data on your computer
- Write: creates and updates files with outputs
- Bash: runs terminal commands, Python scripts, any executable

You describe the goal. Claude Code sequences the tools to get there.

```
You say: 'Read my BTC_daily.csv, calculate Sharpe ratio, maxdrawdown, and  
win rate for every month in 2024, save toanalysis_2024.csv'
```

```
Claude Code executes:
```

1. Read BTC_daily.csv [Read tool]
2. Write analysis script [Write tool]
3. Execute the script [Bash tool]
4. Write results to CSV [Write tool]
5. Confirm completion

Four steps. Zero coding required from you. One sentence.

WHAT THE TOOLKIT IS

The claude-trading-skills repository was built first as a practical workflow for the author's own trading, then shared openly for others facing the same constraints. It is not a signal service. It is a decision-support and process-improvement system.

These are the concepts that determine whether you get real results or waste weeks. Learn them once.

1. The Terminal

Claude Code lives in the terminal.

Mac: Command + Space, type Terminal.

Windows: Windows key, type cmd. Type 'claude' to start.

Plain English from there.

2. Prompts: Specificity Is Everything

Claude Code takes actions, not just generates text. Vague prompts produce actions that are not what you wanted.

WEAK	STRONG
Analyze my portfolio	Read positions.csv. Calculate expected return, volatility, Sharpe ratio. Output sorted by Sharpe descending. Save to portfolio_analysis.csv
Build a screener	Screen BTC, ETH, SOL for days where 10-day return > 5% AND volume > 1.5x 20-day average AND RSI < 65. Output as CSV with date, asset, signal, volume_ratio
Check my risk	Read open_positions.csv. Calculate portfolio heat, max single-position loss at stop, total portfolio risk as % of account. Flag any position over 2% risk

3. Permissions

Claude Code asks before acting. Pre-approve reading files, running your scripts, git operations. Keep the gate on anything touching the internet or installing software.

4. Tools (Read, Write, Bash)

Three tools, automatic selection. You describe the goal. Claude Code picks the sequence.

5. Context Window

Claude's short-term memory. Every message, every file read, every response fills it up. Keep sessions focused on one task. Use `/compact` when a session gets long. Use `/clear` for a fresh start.

⚠ CONTEXT WINDOW AND BIG DATA

For crypto traders working with large datasets, tick data, or multiple timeframe CSVs, the context window fills faster than you expect. One task per session. Always.

6. CLAUDE.md: Permanent Memory

Your project memory file. Claude reads it at every session start. Minimum contents for a crypto trader:

- Data format: daily OHLCV, UTC timestamps, no adjusted prices
- Exchange(s) you trade on and account type (spot, margin, perpetuals)
- Risk rules: max risk per trade, max positions, max daily drawdown
- Position sizing method: fixed % risk, fixed dollar, Kelly
- Preferred Python libraries: pandas, ta-lib, ccxt, vectorbt
- Output preferences: CSV for data, PNG for charts, JSON for configs
- Strategy definitions: how you define your main setups

7. Memory vs. CLAUDE.md

CLAUDE.md is your explicit setup file. Memory is what Claude learns automatically across sessions. Use both. CLAUDE.md for hard rules. Memory for preferences that evolve.

8. Models

MODEL	USE CASE
Haiku	Fast and cheap: file renaming, simple lookups, reformatting
Sonnet (default)	90% of trading work: research, analysis, backtesting, screening
Opus	Complex reasoning: multi-step strategy debugging, deep analysis

9. /compact and /clear

/compact: summarizes and clears noise, keeps the session going. /clear: full reset for a new task. One task per session is the rule.

10. MCP Servers

Model Context Protocol. The connection layer between Claude Code and external data sources. Point Claude at the source. It reads live. No manual data handling.

11. Slash Commands and Skills

/init sets up a project. /compact clears context. Create custom commands for recurring workflows. Skills are pre-written instruction sets that make Claude expert at specific task types. Build once, reuse forever.

12. Sub-Agents

For complex tasks, Claude Code spins off specialist agents in parallel. Portfolio review: one agent for technicals, one for fundamentals, one for news. Faster and cleaner than one agent trying to hold everything.

13. Headless Mode (-p flag)

Run Claude Code autonomously with the -p flag. No prompts, no approvals. Schedule it with cron. Your daily workflows run automatically while you sleep.

14. Worktrees

Multiple Claude Code instances on the same project, each isolated. Build a screener in one. Debug a backtest in another. Analyze this week's trades in a third. Merge when done.

15. Voice Prompts

Typed prompts are short because you edit yourself. Spoken prompts are 2-3x longer because you explain naturally. More detail means better instructions means better outputs. Use any voice-to-text tool for your session prompts.

04

The Claude Trading Skills Toolkit

The open-source system built for traders

There is a public GitHub repository called `claude-trading-skills` at github.com/tradermonty/claude-trading-skills. Think of it as a ready-made operating system for your trading research workflow. 1,500+ stars, 367 forks, actively maintained, completely free.

The Official Mission Statement

The goal is not to outsource buy/sell decisions to AI. The goal is to structure market review, risk management, trade planning, journaling, and continuous improvement. It is open source because the workflows, checklists, and review habits behind better trading decisions can improve through shared practice. This is not a signal service or a promise of profitability.

-- [claude-trading-skills README](#)

Who It Is Built For

TRADER TYPE	HOW IT HELPS
Time-constrained individual investors	Structured workflows that run fast with minimal manual input
Long-term + swing hybrid traders	Core portfolio review + satellite swing opportunity tools

Dividend and ETF investors	Dividend screening, portfolio monitoring, kanchi-style review
Traders who want to manage risk first	Position sizing, exposure coaching before setup hunting
Anyone who journals trades	Structured logging, postmortem review, hypothesis building

WHAT IT IS NOT

Not designed for fully automated trading, signal outsourcing, or short-term scalping. You remain in control of every execution decision.

The Five Recommended Starting Workflows

These are the official entry points from the repository's README. Each one is a machine-readable manifest linking the exact skills, decision gates, and artifacts in order:

Goal	Workflow	Anchor Skills	API Profile
15-min daily market check	market-regime-daily	market-breadth-analyzer, uptrend-analyzer, exposure-coach	No API for basic path
Weekly portfolio review	core-portfolio-weekly	portfolio-manager, kanchi-dividend-review-monitor, trader-memory-core	Alpaca required
Find swing candidates when risk is allowed	swing-opportunity-daily	vcp-screener, technical-analyst, position-sizer	FMP for screeners
Record and learn from closed trades	trade-memory-loop	trader-memory-core, signal-postmortem	No API for manual path
Monthly performance review and rule adjustment	monthly-performance-review	trader-memory-core, signal-postmortem, backtest-expert	No API for manual path

Six skill areas, 40+ skills, all in production. Here is what each one does, when to use it, and what it needs.

SKILL AREA 1: Market Regime - Know Before You Trade

The single most common mistake: jumping straight to setup hunting without checking market conditions. The best setups fail in broken markets. These skills answer the only question that matters first: should I be in the market right now?

Market Breadth Analyzer

Quantifies market health using TraderMonty's public CSV data, specifically the S&P 500 Breadth Index (200-Day MA based) and the US Stock Market Uptrend Stock Ratio. No API required.

- What it tells you: percentage of stocks in healthy uptrends, whether breadth is expanding or contracting
- When to use: daily, first thing, before any setup review
- Output: breadth score, trend direction, exposure recommendation

Breadth Chart Analyst

Used when you have chart images of the breadth indicators and want a structured analysis. Reads the S&P 500 Breadth Index and Uptrend Stock Ratio charts visually and outputs interpretation. Requires chart image, no API.

Uptrend Analyzer

Analyzes market breadth using the Uptrend Ratio Dashboard data to diagnose the current environment. When uptrend participation drops below 50%, reduce new position sizing significantly. Free public CSV, no API.

Downtrend Duration Analyzer

Analyzes historical downtrend durations and generates interactive HTML histograms showing typical correction lengths by sector and market cap. Helps you calibrate how long to expect a correction to last based on historical patterns. Local calculation only.

Exposure Coach

Generates a one-page Market Posture summary combining breadth, regime, and flow signals. Outputs a net exposure ceiling, growth-vs-value bias, participation breadth score, and a clear binary: new entries allowed vs. cash priority. Local calculation, optional FMP when institutional flow data is included.

Market Top Detector

Detects market top probability using three signals: O'Neil Distribution Days, Minervini Leading Stock Deterioration, and Monty Defensive Sector Rotation. When all three fire simultaneously, start reducing exposure. Uses public CSV data, no paid API.

FTD Detector

Detects Follow-Through Day signals for market bottom confirmation using William O'Neil's methodology. A significant index gain on higher volume, occurring on day 4 or later of an attempted rally, is the signal that institutional buyers are stepping in. Requires FMP API.

IBD Distribution Day Monitor

Counts Distribution Days on QQQ and SPY. Risk classification: 0-3 days NORMAL, 4-5 days CAUTION, 6+ days HIGH to SEVERE. Days expire after 25 sessions or if the index rallies 5%+ from the Distribution Day close. Requires FMP for daily QQQ/SPY OHLCV.

Macro Regime Detector

Detects structural macro regime transitions across a 1-2 year horizon using cross-asset ratio analysis. Tracks stocks vs. bonds, growth vs. value, credit spreads, yield curve, commodity momentum. Requires FMP or yfinance.

Market Environment Analysis

Comprehensive market environment analysis and reporting tool. Requires web search for current data. Chart image optional for additional context. Gives you the full macro picture in one output.

Market News Analyst

Analyzes recent market-moving news events and their impact on equity markets and commodities. Requires web search. Use this daily to understand the narrative driving price action.

Sector Analyst

Analyzes sector rotation patterns and market cycle positioning. Provide chart images of sector ETF weekly charts. Get a rotation analysis: which sectors are leading, lagging, and at what cycle phase. For crypto: substitute BTC, ETH, DeFi, L2, AI tokens for traditional sectors.

US Market Bubble Detector

Scores current market conditions for bubble risk using the Minsky/Kindleberger framework v2.1. Tracks valuations, margin debt, IPO activity, volatility compression, and sentiment extremes. Outputs a 0-100 risk score. User input required, no API.

SKILL AREA 2: Core Portfolio - Know What You Own

Portfolio Manager

Comprehensive live portfolio analysis via Alpaca MCP. Fetches actual holdings, calculates allocation, computes risk metrics (beta, volatility, concentration), generates HOLD/ADD/TRIM/SELL flags for each position. Alpaca API required.

Value Dividend Screener

Screens for dividend stocks combining value characteristics: P/E under 20, P/B under 2, yield 3%+, dividend + revenue + EPS all trending up over 3 years. FMP required. FINVIZ Elite reduces execution time 70-80%.

Dividend Growth Pullback Screener

Finds high-quality dividend growth stocks (12%+ annual dividend growth, 1.5%+ yield) with RSI at or below 40. Quality companies on oversold pullbacks. FMP required, FINVIZ recommended.

Kanchi Dividend SOP

Converts Kanchi-style dividend investing into a repeatable 5-step US-stock operating procedure. Universe definition, quality filter, yield filter, entry trigger, invalidation conditions. Knowledge workflow, no API needed.

Kanchi Dividend Review Monitor

Monitors dividend portfolios with 5 forced-review triggers (T1-T5). T1: dividend cut. T2: earnings miss 20%+. T3: fundamental deterioration. T4: technical breakdown. T5: thesis invalidation. Flags OK, WARN, or REVIEW. Local rule engine, no API.

Kanchi Dividend US Tax Accounting

US dividend tax and account-location workflow for Kanchi-style income portfolios. Aligns holdings with qualified-dividend assumptions and account location (taxable vs. tax-advantaged). Local calculation, no API.

SKILL AREA 3: Swing Opportunity - Find the Setups

Only use these when the Market Regime gives you a green light. Screening for setups in a broken market finds great charts that immediately fail.

VCP Screener

Screens S&P 500 stocks for Mark Minervini's Volatility Contraction Pattern. Stage 2 uptrend + progressive volatility contraction + volume decline into base + near pivot breakout point. FMP required. Free tier sufficient for 35 stocks.

CANSLIM Screener

Scores stocks on William O'Neil's 7-factor CANSLIM methodology with multi-period Relative Strength calculations. Phase 3.1 with 7 components. FMP required. Free tier sufficient for 35 stocks. FINVIZ web scraping handles institutional data.

Breakout Trade Planner

Generates Minervini-style breakout trade plans from VCP screener output. Pivot breakout price, stop loss, position size, portfolio heat, Alpaca-compatible order templates (stop-limit for pre-placement, limit bracket for post-confirmation). Local calculation, no API.

FINVIZ Screener

Converts natural language screening requests into FINVIZ screener URLs and opens them. Free public screener works without an API. FINVIZ Elite auto-detected via environment variable for faster results.

Theme Detector

Identifies which market themes and narratives are driving capital flows across sectors. Core functionality uses FINVIZ public + yfinance (both free). FMP optional for ETF holdings data. FINVIZ Elite recommended for stock lists. For crypto, this is essential: AI tokens, DePIN, RWA, L2 rotation moves fast.

SKILL AREA 4: Trade Planning - Size It Right

Position Sizer

Calculates exact position size for any trade. Inputs: account size, risk %, entry price, stop loss. Outputs: shares or contracts, dollar exposure, risk amount, portfolio heat after adding this position. Pure local calculation, zero dependencies.

```
Input:Account: $25,000 | Risk: 1.5% | Entry: ETH $3,420
Stop loss: $3,180 (below base support)
Output:
Max risk: $375 (1.5% of account)
Position: 1.56 ETH ($5,335 notional)
Stop distance: 7.02%3R
target: $3,940 (+15.2%)
```

Technical Analyst

Analyzes weekly price charts for stocks, cryptocurrencies, or forex. Upload a chart image. Get: trend structure, key support and resistance, pattern identification, volume analysis, setup quality rating (A+, A, B, C). Chart image required, no API.

US Stock Analysis

Comprehensive fundamental and technical deep-dive. Revenue and earnings growth, margins, ROE, valuation vs. sector, balance sheet health, competitive position. Then technical: trend, key levels, relative strength. User input required, no API.

SKILL AREA 5: Trade Memory - Build Your Edge

Most traders never improve because they never analyze what they are doing. Trade Memory creates the feedback loop between your trades and your decision process.

Trader Memory Core

Tracks every trade from screening idea to closed position with postmortem. Records thesis, entry conditions, exit reason, P&L, R-multiple, and review notes. Stored locally in YAML. FMP optional for MAE/MFE in postmortem. Core features fully offline.

Signal Postmortem

Structured post-trade review. Four questions: Was the setup correct? Was entry timing correct? Was the market environment correct? Was position management correct? After 30 postmortems, patterns emerge that are unique to your trading style. FMP optional for fetching realized returns; manual price entry also supported.

Trade Hypothesis Ideator

Formalizes patterns from postmortems into testable hypotheses. Notice that VCP breakouts work when volume is 150%+ on the breakout day but fail at 100-120%? This skill formats that into a falsifiable hypothesis with ranked hypothesis cards and optional strategy.yaml export. Local calculation, no API.

SKILL AREA 6: Strategy Research - Prove Your Edge

This is where you go from 'I think this works' to 'I know this works.' The most technical skill area and the most valuable for building durable, evidence-based edges.

Backtest Expert

Expert guidance for systematic backtesting. Structured process: define hypothesis, specify exact rules, agree on data, run the test, interpret results with statistical rigor, check for overfitting on out-of-sample data. Prevents the most common mistake: running hundreds of parameter combinations until something looks good. User input required.

Edge Candidate Agent

Generates and prioritizes edge research tickets from End-Of-Day observations. Formalizes market observations before you spend time backtesting them. Outputs pipeline-ready candidate specs for the edge pipeline Phase 1. FMP optional, local YAML generation.

Edge Hint Extractor

Extracts edge hints from daily market observations and news reactions. Outputs canonical hints.yaml for downstream concept synthesis and auto-detection. Local calculation only.

Edge Concept Synthesizer

Abstracts multiple edge detector outputs into reusable edge concepts with defined thesis, invalidation signals, and strategy playbooks. Identifies when multiple observations are the same underlying edge. Stops you from backtesting the same edge five different ways. Local calculation.

Edge Strategy Designer

Converts abstract edge concepts into concrete strategy drafts with exact entry/exit logic, data requirements, parameter set, and expected performance characteristics. Local calculation.

Edge Strategy Reviewer

Critically reviews strategy drafts before backtesting. Checks: edge plausibility, overfitting risk, sample size adequacy, execution realism, survivorship bias. The quality gate that stops you from trading strategies that only work in the backtest. Deterministic scoring on local YAML drafts.

Edge Signal Aggregator

Aggregates and ranks signals from multiple edge-finding skills (edge-candidate-agent, theme-detector, sector-analyst, institutional-flow-tracker) into a prioritized conviction dashboard with weighted scoring and deduplication. Local calculation.

Edge Pipeline Orchestrator

Orchestrates the full edge research pipeline from candidate detection through strategy design, review, revision, and export. The master controller sequencing all edge skills. Orchestrates local edge skills via subprocess. Local calculation.

Stanley Druckenmiller Investment Advisor

Integrates 8 upstream skill outputs into a unified conviction score from 0 to 100. Inspired by Druckenmiller's macro-to-micro framework. The 8 inputs: Market Breadth, Uptrend Analysis, Market Top probability, Macro Regime, FTD Detector, VCP Screener, Theme Detector, CANSLIM Screener. Output: one number telling you how aggressive or defensive to be. Local calculation.

Strategy Pivot Designer

Detects backtest iteration stagnation and generates structurally different pivot proposals when parameter tuning reaches a local optimum. Stops you from over-optimizing one approach when you should be testing a fundamentally different one. Local calculation.

Scenario Analyzer

Analyzes any news event or catalyst through an 18-month scenario framework via scenario-analyst agent with strategy-reviewer second opinion. Outputs primary, secondary, and tertiary impact scenarios with stock picks for each. Requires web search.

ADVANCED SATELLITE SKILLS

Beyond the six core areas, these skills cover specific high-value use cases:

Earnings Trade Analyzer

Analyzes recent post-earnings stocks using a 5-factor scoring system: Gap Size, Pre-Earnings Trend, Volume Trend, MA200 Position, MA50 Position. Finds the best PEAD setup candidates. FMP required.

PEAD Screener

Screens for Post-Earnings Announcement Drift patterns. Finds red candle pullbacks from initial gap-ups that are setting up for continuation breakout signals. One of the most consistent short-term edges in equities. FMP required.

Institutional Flow Tracker

Tracks institutional investor ownership changes and portfolio flows using 13F filings data. Understand what the big money is actually doing. FMP required, free tier sufficient.

Pair Trade Screener

Statistical arbitrage tool for identifying cointegrated stock pairs within sectors. Analyzes mean-reversion metrics, half-life, z-score, and hedge ratios for market-neutral setups. FMP required.

Options Strategy Advisor

Options trading strategy analysis and simulation using Black-Scholes pricing. Compares covered calls, spreads, straddles, strangles. FMP optional for stock data; theoretical pricing works without it.

Parabolic Short Trade Planner

Screens US equities for parabolic exhaustion patterns and generates conditional pre-market short plans. Phase 1 screener (FMP required) finds candidates. Phase 2 checks borrow availability (Alpaca optional). Phase 3 evaluates intraday trigger fires from live 5-min bars (Alpaca required for paper feed). No SDK, requests direct.

Individual skills are tools. Workflows are how you use those tools to build a consistent process. These are the complete workflows from the repository.

Daily Market Check (15 Minutes, Every Morning)

Run this before you look at any setup, check any price, or think about any trade.

1. Economic Calendar Fetcher: what high-impact events are scheduled today? FOMC, CPI, NFP, earnings. Do not initiate new swing positions right before major catalysts.
2. Earnings Calendar: which major companies report today or after the close? Even if you are not trading them, sector leaders move the group.
3. Market News Analyst: what happened overnight? Get context before the session opens.
4. Market Breadth Analyzer: is breadth expanding, stable, or contracting? This sets your aggression level.

Weekly Strategy Review

5. Sector Analyst: which sectors are leading and lagging? Where is capital rotating?
6. Technical Analyst: weekly charts on major indices and your watchlist
7. Market Environment Analysis: comprehensive macro briefing
8. US Market Bubble Detector: where are we on the risk spectrum?

Swing Trade Setup Workflow

Only run when the market regime gives you a green light for new positions.

9. Exposure Coach: what is the current recommended exposure ceiling? Do not exceed it.
10. VCP Screener or CANSLIM Screener: run the screen, get the candidates
11. Technical Analyst: for each top candidate, upload the weekly chart, get setup quality rating
12. Breakout Trade Planner: complete trade plan with entry trigger, stop, size, portfolio heat
13. Position Sizer: confirm exact size based on your current account and open positions

Post-Trade Review Workflow (Every Closed Trade)

14. Signal Postmortem: was the setup, timing, environment, and management correct?

15. Trader Memory Core: log thesis, entry, exit, result, review notes
16. Trade Hypothesis Ideator: formalize any pattern you notice into a testable hypothesis

Earnings Momentum Workflow (PEAD)

17. Earnings Trade Analyzer: score recent earnings reactions on 5-factor system
18. PEAD Screener Mode B: find red candle pullbacks from initial gap-ups
19. Technical Analyst: confirm weekly patterns and key levels
20. Position Sizer: size the trade with stop at red candle low, target 2-3R

Headless Automation Workflow

Once comfortable with manual workflows, automate the repetitive parts using the -p flag:

- End-of-day journal update: runs at a set time daily, updates trade log automatically
- Morning market brief: runs before your session, prepares your daily context file
- Weekly breadth data pull: runs Sunday evening, downloads fresh CSVs for weekly review

07

6 Lessons From 900+ Hours of using Claude Code

What the time actually teaches

Lesson 1: Plan Before You Build

AI moves fast. Without a plan, fast is the problem.

-- SoulzBTC

Before any code, before any backtest: tell Claude your strategy idea and ask it to ask you questions first.

```
'I want to build a BTC momentum strategy trading daily closes.Ask me everything you need to know before we write any code.Do not assume anything.'
```

What comes back is a list of every decision you have not made yet. Making these decisions in the planning phase costs 10 minutes. Making them after 300 lines of code costs an afternoon.

Lesson 2: The Junior Quant Mental Model

Claude Code is capable, fast, and confidently wrong when given vague instructions. Give it clear, specific, bounded tasks with no room for interpretation.

```
Weak: 'Write a backtest for my strategy'

Strong: 'Write a Python function called run_backtest that takes a DataFrame with columns [date, open, high, low, close, volume] and returns a DataFrame with columns [date, signal, entry_price,exit_price, pnl_pct, cumulative_pnl].

Entry: signal = 1 when 10-day return > 3% ANDvolume > 1.5x 20-day average AND RSI(14) < 65.

Exit: 10-day holding period OR stop loss at -5%.No print statements. No charts. Just the function.'
```

Lesson 3: One Task Per Session

Long sessions produce inconsistent outputs. One task per session. When you finish and want to do something different, type /clear and start fresh.

Lesson 4: Build Your CLAUDE.md in Week One

Without CLAUDE.md: every session starts from zero. You spend 15 minutes re-explaining your setup. With CLAUDE.md: every session starts with full context. 30 minutes in week one pays back every session forever.

Lesson 5: Voice Prompt Everything

Typed prompts are short. Voice prompts are 2-3x longer and more complete. The detail you naturally add when speaking is exactly the detail Claude Code needs to get the output right.

Lesson 6: The Traders Who Win Are Not the Best Coders

The traders building the most effective AI trading systems are not the ones with CS degrees. They are the ones who figured out that the human's job is to be a good manager: clear instructions, specific goals, structured feedback.

THE REAL EDGE

Every hour you spend gathering data manually, formatting spreadsheets, or running repetitive calculations is an hour you are not spending on strategy and decision making. That is what you should be optimizing for.

This is the definitive reference table for all 40+ skills in the claude-trading-skills toolkit. Pulled directly from the official repository README and skills-index.yaml.

Legend: Required means the skill will not function without it. Optional means the skill works but is slower, less complete, or falls back to manual input. Not used means there is zero dependency.

Skill	FMP API	FINVIZ Elite	Alpaca	Notes
MARKET REGIME				
Market Breadth Analyzer	✗ Not used	✗ Not used	✗ Not used	Free GitHub CSV data; no API required
Uptrend Analyzer	✗ Not used	✗ Not used	✗ Not used	Free GitHub CSV data; no API required
Breadth Chart Analyst	✗ Not used	✗ Not used	✗ Not used	Chart image required; no API needed
Sector Analyst	✗ Not used	✗ Not used	✗ Not used	Free GitHub CSV + optional chart images
Market Top Detector	✗ Not used	✗ Not used	✗ Not used	Uses public CSV; no paid API needed
Downtrend Duration Analyzer	✗ Not used	✗ Not used	✗ Not used	Local calculation only
Exposure Coach	🟡 Optional	✗ Not used	✗ Not used	FMP only when institutional-flow-tracker data included
FTD Detector	✅ Required	✗ Not used	✗ Not used	Index price data for rally/FTD detection
IBD Distribution Day Monitor	✅ Required	✗ Not used	✗ Not used	Daily QQQ/SPY OHLCV for Distribution Day detection

Macro Regime Detector	✓ Required	✗ Not used	✗ Not used	Cross-asset ETF ratio analysis; yfinance also works
Market Environment Analysis	✗ Not used	✗ Not used	✗ Not used	Requires web search; chart image optional
Market News Analyst	✗ Not used	✗ Not used	✗ Not used	Requires web search only
US Market Bubble Detector	✗ Not used	✗ Not used	✗ Not used	User input required; no API needed
CORE PORTFOLIO				
Portfolio Manager	✗ Not used	✗ Not used	✓ Required	Real-time holdings via Alpaca MCP
Value Dividend Screener	✓ Required	● Optional	✗ Not used	FINVIZ reduces execution time 70-80%
Dividend Growth Pullback Screener	✓ Required	● Optional	✗ Not used	FINVIZ for RSI pre-screening
Kanchi Dividend SOP	✗ Not used	✗ Not used	✗ Not used	Knowledge workflow; uses outputs from other skills
Kanchi Dividend Review Monitor	✗ Not used	✗ Not used	✗ Not used	Local rule engine; consumes normalized input JSON
Kanchi Dividend US Tax Accounting	✗ Not used	✗ Not used	✗ Not used	Knowledge workflow for classification/account location
SWING OPPORTUNITY				
VCP Screener	✓ Required	✗ Not used	✗ Not used	Stage 2 + VCP pattern screening; free tier sufficient
CANSLIM Screener	✓ Required	✗ Not used	✗ Not used	Phase 3.1 (7 components, multi-period RS); free tier OK for 35 stocks
Breakout Trade Planner	✗ Not used	✗ Not used	✗ Not used	Local calculation from VCP output; no API needed
FINVIZ Screener	✗ Not used	● Optional	✗ Not used	Public screener free; Elite auto-detected via \$FINVIZ_API_KEY

Theme Detector	● Optional	● Optional	✗ Not used	Core uses FINVIZ public + yfinance (free). FMP for ETF holdings
TRADE PLANNING				
Position Sizer	✗ Not used	✗ Not used	✗ Not used	Pure local calculation; zero dependencies
Technical Analyst	✗ Not used	✗ Not used	✗ Not used	Chart image required; no API needed
US Stock Analysis	✗ Not used	✗ Not used	✗ Not used	User input required; no API needed
TRADE MEMORY				
Trader Memory Core	● Optional	✗ Not used	✗ Not used	FMP only for MAE/MFE in postmortem; core features work offline
Signal Postmortem	● Optional	✗ Not used	✗ Not used	FMP for fetching realized returns; manual price entry also supported
Trade Hypothesis Ideator	✗ Not used	✗ Not used	✗ Not used	Local JSON hypothesis pipeline with optional strategy export
STRATEGY RESEARCH				
Backtest Expert	✗ Not used	✗ Not used	✗ Not used	User input required; no external API needed
Edge Candidate Agent	● Optional	✗ Not used	✗ Not used	Local YAML generation; validates against local pipeline repo
Edge Concept Synthesizer	✗ Not used	✗ Not used	✗ Not used	Local calculation only
Edge Hint Extractor	✗ Not used	✗ Not used	✗ Not used	Local calculation only
Edge Pipeline Orchestrator	✗ Not used	✗ Not used	✗ Not used	Orchestrates local edge skills via subprocess
Edge Signal Aggregator	✗ Not used	✗ Not used	✗ Not used	Aggregates local edge-skill JSON/YAML into weighted ranked signals

Edge Strategy Designer	✗ Not used	✗ Not used	✗ Not used	Local calculation only
Edge Strategy Reviewer	✗ Not used	✗ Not used	✗ Not used	Deterministic scoring on local YAML drafts
Stanley Druckenmiller Advisor	✗ Not used	✗ Not used	✗ Not used	Local calculation integrating 8 upstream skill outputs
Strategy Pivot Designer	✗ Not used	✗ Not used	✗ Not used	Local calculation only
Scenario Analyzer	✗ Not used	✗ Not used	✗ Not used	Requires web search only
ADVANCED SATELLITE				
Earnings Trade Analyzer	✓ Required	✗ Not used	✗ Not used	5-factor scoring system; FMP required
PEAD Screener	✓ Required	✗ Not used	✗ Not used	Post-earnings gap-up screening; FMP required
Institutional Flow Tracker	✓ Required	✗ Not used	✗ Not used	13F filings analysis; free tier sufficient
Pair Trade Screener	✓ Required	✗ Not used	✗ Not used	Statistical arbitrage analysis
Options Strategy Advisor	● Optional	✗ Not used	✗ Not used	FMP for stock data; theoretical pricing works without
Parabolic Short Trade Planner	✓ Required	✗ Not used	✓ Ph3 / ● Ph2	FMP for Phase 1; Alpaca required for Phase 3 intraday bars (paper feed OK); optional Phase 2 borrow checks
META / DEVELOPMENT TOOLING				
Earnings Calendar	✓ Required	✗ Not used	✗ Not used	Fetches earnings dates via FMP
Economic Calendar Fetcher	✓ Required	✗ Not used	✗ Not used	Fetches economic events via FMP
Data Quality Checker	✗ Not used	✗ Not used	✗ Not used	Works offline on local markdown files
Skill Designer	✗ Not used	✗ Not used	✗ Not used	No API key required

Skill Idea Miner	✗ Not used	✗ Not used	✗ Not used	Mines Claude Code session logs; no API needed
Dual-Axis Skill Reviewer	✗ Not used	✗ Not used	✗ Not used	Deterministic scoring + optional LLM review; no API

Free Stack (Zero Cost)

You can run a complete market review and trade journaling workflow with zero API costs. Everything in the Market Regime (except FTD and IBD), all Trade Planning, all Trade Memory, all Strategy Research skills work with no paid APIs.

Financial Modeling Prep (FMP)

Free tier: 250 requests per day. Sufficient for most individual trader use cases.

- Sign up: financialmodelingprep.com/developer/docs
- Setup: `export FMP_API_KEY=your_key_here` in your terminal config (`.bashrc`, `.zshrc`)
- Or provide the key via command-line argument when prompted by any skill

What it unlocks: VCP Screener, CANSLIM Screener, FTD Detector, IBD Distribution Day Monitor, Macro Regime Detector, Earnings Calendar, Economic Calendar Fetcher, Earnings Trade Analyzer, PEAD Screener, Institutional Flow Tracker, Pair Trade Screener, dividend screeners, and more.

FINVIZ Elite

- Cost: \$39.50 per month or \$299.50 per year
- Sign up: elite.finviz.com
- Setup: `export FINVIZ_API_KEY=your_key_here`
- What it does: speeds up dividend screeners by 70-80%, auto-detected by FINVIZ Screener skill
- Verdict: not needed to start. Revisit when execution time actually bothers you.

Alpaca Trading API

- Cost: free paper trading account. No cost for API access.
- Sign up: alpaca.markets
- Requires Alpaca MCP Server configuration

Environment variables:

```
export ALPACA_API_KEY="your_api_key_id"
export ALPACA_SECRET_KEY="your_secret_key"export ALPACA_PAPER="true"
# use 'false' for live trading
```

 PAPER FIRST

Set ALPACA_PAPER='true' until you have run every workflow in paper mode and are fully confident in the outputs. No exceptions.

WHAT YOU NEED	COST
Claude Code (via Claude.ai)	Included in Claude subscription
FMP API (free tier)	\$0/month
Alpaca paper trading	\$0
FINVIZ Elite (optional speed)	\$39.50/month or \$299.50/year

Beyond the six trading skill areas, the repository includes a Meta/Development Tooling layer and an automated self-improvement system. Most traders never need to touch this layer. But understanding it helps you understand how the toolkit evolves over time and how you can contribute to it.

Meta / Development Tooling

Earnings Calendar

Retrieves upcoming earnings announcements for US stocks using the FMP API. Used as an input to the daily routine and weekly strategy review workflows. FMP required.

Economic Calendar Fetcher

Fetches upcoming high-impact economic events and data releases using the FMP API. FOMC meetings, CPI, NFP, PPI, PCE, GDP. FMP required.

Data Quality Checker

Validates data quality in market analysis documents and blog articles before publication. Checks five categories:

- Price scale inconsistencies (ETF vs. futures digit differences)
- Instrument notation consistency across the document
- Date and weekday mismatches (supports English and Japanese)
- Allocation total errors (section-limited checks)
- Unit mismatches

Advisory mode: flags issues as warnings for human review, exits cleanly even with findings. Supports full-width Japanese characters, range notation (50-55%), and year inference for dates without explicit year. No API required, works offline on local markdown files.

Skill Designer

Generates Claude CLI prompts for designing new skills from structured idea specifications. Embeds repository conventions (structure guide, quality checklist, SKILL.md template) into the prompt. Lists existing skills to prevent duplication. Used by the skill auto-generation pipeline's daily flow. No API required.

Dual-Axis Skill Reviewer

Reviews skill quality using a two-axis method:

- Axis 1 (Deterministic): automated scoring of structure, scripts, tests, and execution safety
- Axis 2 (LLM): qualitative review for correctness, risk, missing logic, and maintainability

5-category auto axis scoring (0-100 total):

- Metadata and Use Case: 20 points
- Workflow Coverage: 25 points
- Execution Safety and Reproducibility: 25 points
- Supporting Artifacts: 10 points
- Test Health: 20 points

Detects knowledge_only skills (references only, no scripts) and adjusts scoring to avoid unfair penalties. Supports --all flag to review every skill at once, --skip-tests for quick triage, and --project-root for cross-project review. No API required.

Skill Idea Miner

Mines Claude Code session logs for skill idea candidates. Scores each idea for novelty, feasibility, and trading value. Maintains a prioritized backlog. Used by the weekly skill auto-generation pipeline but can also be run manually. No API required.

The Skill Self-Improvement Loop

This is an automated pipeline that continuously reviews and improves skill quality. A daily scheduled job picks one skill, scores it, and if the score is below 90/100, invokes Claude Code to apply improvements and open a pull request.

This section is contributor-oriented. New users can skip it entirely. But it is worth understanding because it explains why the toolkit keeps getting better automatically.

How the Self-Improvement Loop Works

STEP	WHAT HAPPENS
1. Round-robin selection	Cycles through all skills (excluding the reviewer itself), persisted in logs/.skill_improvement_state.json
2. Auto scoring	Runs run_dual_axis_review.py to get a deterministic score from 0 to 100

3. Improvement gate	If auto_review.score < 90, Claude Code applies fixes to SKILL.md and reference files
4. Quality gate	Re-scores after improvement with tests enabled. Rolls back if the score did not improve.
5. PR creation	Commits changes to a feature branch and opens a GitHub PR for human review
6. Daily summary	Writes results to reports/skill-improvement-log/YYYY-MM-DD_summary.md

Running It Manually

```
# Dry-run: score one skill without applying changes or creating PR
python3 scripts/run_skill_improvement_loop.py --dry-run#

Review all skills in dry-run mode
python3 scripts/run_skill_improvement_loop.py --dry-run --all#

Full run: score, improve if needed, open PR
python3 scripts/run_skill_improvement_loop.py
```

macOS launchd Setup (Automated Daily Run)

```
# Install the agent (runs daily at 05:00)
cp launchd/com.trade-analysis.skill-improvement.plist \
~/Library/LaunchAgents/launchctl load \
~/Library/LaunchAgents/com.trade-analysis.skill-improvement.plist#

Verify it loaded
launchctl list | grep skill-improvement#

Trigger manually
launchctl start com.trade-analysis.skill-improvement
```

KEY FILE	PURPOSE
scripts/run_skill_improvement_loop.py	Orchestration: selection, scoring, improvement, PR
scripts/run_skill_improvement.sh	Thin shell wrapper for launchd
launchd/com.trade-analysis.skill-improvement.plist	macOS launchd agent configuration

skills/dual-axis-skill-reviewer/	The reviewer skill (scoring engine)
logs/.skill_improvement_state.json	Round-robin state and run history
reports/skill-improvement-log/	Daily summary reports

The Skill Auto-Generation Pipeline

An automated pipeline that mines session logs for skill ideas weekly and designs, reviews, and creates new skills as pull requests daily. Works alongside the Self-Improvement Loop to continuously expand the skill catalog.

How the Auto-Generation Pipeline Works

STEP	WHAT HAPPENS
1. Weekly mining	Scans Claude Code session logs for recurring patterns that could become skills. Scores each idea for novelty, feasibility, and trading value.
2. Backlog scoring	Ranked ideas stored in logs/.skill_generation_backlog.yaml with status: pending, in_progress, completed, design_failed, review_failed, pr_failed
3. Daily selection	Picks highest-scoring pending idea. Retries design_failed and pr_failed once. review_failed is terminal.
4. Design and review	Skill Designer builds complete skill (SKILL.md, references, scripts). Dual-Axis Reviewer scores it. Too low = marked review_failed.
5. PR creation	Commits new skill to a feature branch and opens a GitHub PR for human review

Running It Manually

```
# Weekly: mine ideas from session logs
python3 scripts/run_skill_generation_pipeline.py \
  --mode weekly --dry-run#
```

```
Daily: design a skill from the highest-scoring ideapython3
scripts/run_skill_generation_pipeline.py \    --mode daily --dry-run#

Full daily run (creates branch, designs skill, opens PR)python3
scripts/run_skill_generation_pipeline.py --mode daily
```

macOS launchd Setup

```
# Install both agentscp
launchd/com.trade-analysis.skill-generation-weekly.plist \
~/Library/LaunchAgents/cp
launchd/com.trade-analysis.skill-generation-daily.plist \
~/Library/LaunchAgents/launchctl load \
~/Library/LaunchAgents/com.trade-analysis.skill-generation-weekly.plistlaun
chctl load \
~/Library/LaunchAgents/com.trade-analysis.skill-generation-daily.plist#
Verifylaunchctl list | grep skill-generation# Manual triggerslaunchctl
start com.trade-analysis.skill-generation-weeklylaunchctl start
com.trade-analysis.skill-generation-daily
```

KEY FILE	PURPOSE
scripts/run_skill_generation_pipeline.py	Orchestration: mining, selection, design, review, PR
scripts/run_skill_generation.sh	Thin shell wrapper for launchd
launchd/...skill-generation-weekly.plist	Weekly mining schedule (Saturday 06:00)
launchd/...skill-generation-daily.plist	Daily generation schedule (07:00)
skills/skill-idea-miner/	Mining and scoring skill
skills/skill-designer/	Skill design prompt builder
logs/.skill_generation_backlog.yaml	Scored idea backlog with status tracking
logs/.skill_generation_state.json	Run history and state

reports/skill-generation-log/

Daily generation summary reports

Customization and Contribution

If you want to extend the toolkit or contribute back to the repository:

- Update SKILL.md files to tweak trigger descriptions or capability notes. Ensure the frontmatter name matches the folder name when zipping.
- Extend reference documents or add scripts inside each skill folder to support new workflows.
- When distributing updates, regenerate the matching .skill file in skill-packages/ so web-app users get the latest version.

OPEN SOURCE SPIRIT

The project follows a 'first for self, open for others' stance. It was built as a practical workflow the author actually uses, then shared openly. If you build something useful on top of it, the community benefits from you sharing it back.

11

Your Week-by-Week Starting Path

No overwhelm. Just the next step.

You do not need to build everything at once. Here is the exact progression to follow if you are starting from scratch today.

Week 1: Foundation

Day 1: Install and Configure

1. Install Claude Code via your Claude subscription (see docs.anthropic.com for current instructions)
2. Create your trading project folder: `mkdir trading-claude && cd trading-claude`
3. Create CLAUDE.md with your data format, exchange, account type, risk rules, and preferred libraries
4. Run a simple test: 'Read the current directory and tell me what you see.' Confirm it works.

Day 2: First Market Regime Check

5. Download the claude-trading-skills repository from github.com/tradermonty/claude-trading-skills
6. Run market-breadth-analyzer using the public CSV data
7. Run uptrend-analyzer
8. Read the outputs. Understand what the numbers mean for your trading decisions today.

Day 3: First Trade Review

9. Pick one trade you closed in the last 30 days
10. Run it through signal-postmortem. Answer the four questions honestly.
11. Save the output. Trade review number one in your database.

Day 4: Position Sizing Audit

12. Pull your last 5 closed trades
13. Run position-sizer on each one with your actual account size and risk rules
14. Compare the correct sizes to what you actually traded. Note the gap.

Day 5 and Weekend: Build Your Memory

15. Start trader-memory-core. Log 5 trades from the past 2 months.
16. Review everything the tools surfaced. Update your CLAUDE.md with anything you learned.

17. Run the weekly strategy review workflow for the first time.

Week 2: Add FMP

Sign up for FMP free tier. Set the environment variable. Add to your daily routine:

18. Market Top Detector: run daily alongside breadth
19. FTD Detector: run after any significant market decline
20. Earnings Calendar: add to your weekly review

By end of week 2, your daily routine covers breadth, uptrend, top detection, and upcoming catalysts. Approximately 20-25 minutes every morning.

Weeks 3-4: Start Screening

21. Run VCP Screener for the first time. Review the output.
22. For any interesting candidates, run Technical Analyst (upload the weekly chart)
23. For any A or B setups, run Breakout Trade Planner
24. Do not trade anything yet. Just learn to read the outputs and evaluate setup quality.

Month 2: Full Workflow Integration

Every morning: 20-minute daily routine. Every Sunday: weekly strategy review. Every closed trade: postmortem and memory core entry. Weekly: screener run and trade planner for qualifying setups.

At this point you are running a more systematic research process than 90% of retail traders. The compounding effect starts here.

Month 3+: Automate and Research

Start automating repetitive parts using headless mode. Build your first slash command for the morning brief. Start the edge research pipeline if you want to develop systematic strategies.

We started with history because context matters. Every major technology shift in trading created a window where early movers got a real, durable advantage. The window for Claude Code is open right now.

The advantage is not the AI making better trading decisions. The advantage is having more time and cleaner information to make your own decisions better. Claude Code does not replace your judgment. It removes the administrative overhead that blurs it.

For crypto traders especially: 24/7 markets, constant data flow, relentless pace. Every hour spent on admin is an hour not spent on strategy. Build the system now.

Start with CLAUDE.md. Build the foundation. Run the daily routine for 30 days. Review your trade memory log at the end of month one. Let the compounding effect do its work.
